Here's a summary of your latest conversation with Nick, titled **"PO Management Process Review"** from **2026-03-23** [PO Management Process Review]:

High-level Summary

You and Nick walked through how he manages **purchase orders (POs)** on a bi-weekly basis using the **Job Boss** system [PO Management Process Review]. Nick explained how he:

- Reviews **vendor receipt and balance reports**
- Checks **open POs** every 15 days
- Sends **reminders to vendors** for overdue or unclear items
- Ensures POs don't "fall through the system" [PO Management Process Review]

You focused on understanding **exceptions and logistics**:

- You asked how he handles **partial shipments** when only some materials arrive [PO Management Process Review].
- Nick explained that they can **close POs on what's received** and track the remaining items.
- You discussed **consignment orders** where a single PO might be fulfilled from multiple locations (e.g., North Carolina, California) [PO Management Process Review].
- You asked about **shipping dates and delivery times**, and Nick described how delivery can vary:
    - A Monday shipment might arrive in ~3 days.
    - A Friday shipment might not arrive until the following Thursday, depending on origin and carrier schedules [PO Management Process Review].

Main Topics You and Nick Covered

1. **Bi-weekly PO review routine**
    - Using Job Boss reports to see what's been received and what's still open.

    - Systematic follow-up so no PO is missed [PO Management Process Review].

2. **Handling partial receipts**
    - How Nick closes or updates POs when only part of an order arrives.
    - Ensuring received items are accounted for while still tracking outstanding lines [PO Management Process Review].
3. **Consignment and multi-location sourcing**
    - One PO can correspond to items coming from different warehouses/states.
    - Impact of multi-origin shipments on how he reads and manages PO status [PO Management Process Review].
4. **Shipping timelines and variability**
    - How ship date, origin state, and day of week affect ETA.
    - Why you might see 2–3 day deliveries in some cases and longer delays in others [PO Management Process Review].

If you'd like, I can next pull out **action items** from this conversation or create a **step-by-step flow** of Nick's PO management process.

create a step-by-step flow of Nick's PO management process.

Show thinking

Here's a clear step-by-step flow of **Nick's PO management process** based on your conversation [PO Management Process Review].

A. Regular (Bi-weekly) PO Review Cycle

1. **Open Job Boss and Access Reports**
    - Nick logs into **Job Boss** and opens reports that show:
        - Open POs
        - Vendor receipts
        - Remaining balances [PO Management Process Review]
2. **Filter for Open / Outstanding POs**

- Uses Job Boss to list POs that are **still open** or have **balances remaining**.
- Focus is on anything that might have "fallen through the system" [PO Management Process Review].

3. **Review Each Open PO (Every ~15 Days)**
   For each PO in the list, Nick checks:
   - Order date
   - Expected or promised ship/delivery date
   - How long it has been outstanding
   - Whether any receipts have already been logged [PO Management Process Review].
4. **Identify POs Requiring Follow-up**
   - Flags POs that:
     - Are past due based on shipping/delivery expectations
     - Have no recent updates
     - Have unusual partial receipts [PO Management Process Review].
5. **Send Reminders / Follow-up to Vendors**
   - For POs needing attention, Nick:
     - Contacts the vendor (email/phone)
     - References **specific PO numbers**
     - Asks for **status updates**, ship dates, or explanations for delays [PO Management Process Review].

B. Handling Partial Shipments

6. **Check What Has Been Received vs. Ordered**
   - When some, but not all, items arrive:
     - Compares **received quantities** to **ordered quantities** in Job Boss [PO Management Process Review].

7. **Decide How to Treat the PO Line(s)**
   Depending on vendor communication and needs:
   - If remaining items **will still ship**:
     - Keep the PO open with remaining balance outstanding.
   - If remaining items **won't ship** or are no longer needed:
     - Close out lines based on what was actually received.
     - Adjust or close the PO accordingly [PO Management Process Review].
8. **Update Job Boss**
   - Records receipts and any adjustments so the system reflects:
     - What has arrived
     - What is still pending, cancelled, or closed [PO Management Process Review].

C. Consignment & Multi-Location Shipments

9. **Recognize When a PO Is Filled from Multiple Locations**
   - Some POs are **consignments** with material coming from different places (e.g., North Carolina, California) [PO Management Process Review].
10. **Interpret Multiple Shipments Under One PO**
    - Understands that:
      - One PO number may have **separate shipments** from different warehouses.
      - Delivery dates can differ per shipment even under the same PO [PO Management Process Review].
11. **Track Each Shipment's Arrival**
    - Monitors which portion of the PO came from which location.
    - Uses shipping info to explain why certain items show up earlier/later than others [PO Management Process Review].

D. Shipping Timelines & Expectations

12. **Estimate Delivery Timeframes**
    - Uses shipping patterns such as:
        - A **Monday** shipment might arrive in about **three days**.
        - A **Friday** shipment might not arrive until the **following Thursday**, depending on carrier schedule and origin state [PO Management Process Review].
13. **Factor Day-of-Week and Origin into Follow-ups**
    - When reviewing or chasing POs, he considers:
        - The **ship-from location** (e.g., NC vs. CA).
        - The **day of week** it was shipped.
        - Normal transit times before treating something as truly late [PO Management Process Review].

E. Overall Control Loop

14. **Repeat on a Bi-weekly Cadence**
    - Every ~15 days he:
        - Refreshes Job Boss reports
        - Re-identifies problem POs
        - Sends new follow-ups as needed
    - Goal: make sure **no PO gets lost or forgotten** in the system [PO Management Process Review].

If you'd like, I can turn this into a **visual SOP/checklist** (e.g., for training or documentation), or break it into **roles & responsibilities** vs. **system steps** for Job Boss.

What did Nick say about BOMs? How does he create them, what are preliminary and final BOMs?

Show thinking

Here's what Nick said about **BOMs (Bills of Materials)**—how he creates them and the difference between **preliminary** and **final** BOMs—from your "Material Procurement Process Review" meeting [Material Procurement Process Review].

---

1. How Nick Creates BOMs

a. Starting from the drawings

- Nick creates the BOM **directly from the certified/final drawings** [Material Procurement Process Review].
- "Everything is on here that you need" – he uses the **tables and dimensions on the drawings** and does the calculations himself (e.g., diameter × π to get pipe length, etc.) [Material Procurement Process Review].
- For some components (like nozzles), the drawings give **reference dimensions** (e.g., projection from a ring angle), so he measures or calculates what's needed to get actual material length/size [Material Procurement Process Review].

b. Building the BOM in Excel

- He takes input from the drawing and **puts it into an Excel file**, which is the working BOM ("BLM" in the transcript) [Material Procurement Process Review].
- While creating the BOM, he **groups items by material type / vendor**:
  - Pipes together
  - Flanges together
  - Bolt circles together
  - Gaskets together, etc.
    The idea is that "all this item is supplied by same vendor," so he can copy/paste grouped lines into emails for RFQs [Material Procurement Process Review].

c. Using the BOM for RFQs

- From the BOM, he sends **RFQs (requests for quote)** by email to **2–3 vendors per item** on average [Material Procurement Process Review].

- He copies BOM lines (already grouped) and pastes them into the RFQ email instead of using Job Boss's RFQ module (he finds the built-in RFQ tool "extra work") [Material Procurement Process Review].
- Once quotes come back:
    - He compares price (and sometimes lead time) **line by line** against what was requested [Material Procurement Process Review].
    - He then **creates POs in Job Boss** using those quote details (unit cost / total cost, ship method, dates, etc.) [Material Procurement Process Review].

---

2. Stages of the BOM: Long-Lead, Preliminary, Final

Nick explicitly describes **three stages** of the BOM [Material Procurement Process Review]:

Stage 1: Long-Lead BOM

- This BOM shows only the **top few major/expensive lines**:
    - Heads
    - Exotic materials
    - Plate material
    - Big flanges
      These are items that:
    - Have **long lead times** (typically **4–6+ weeks**).
    - Represent the **majority of the job's cost** [Material Procurement Process Review].
- Purpose:
    - He buys these **immediately after the job number is created in Job Boss**, so they are on order early [Material Procurement Process Review].
    - This is to **lock in price and lead time** so the company can honor the quoted price to the customer even if the market moves [Material Procurement Process Review].

In short:
Long-lead BOM = subset of big/critical items bought early to protect schedule and pricing.

Stage 2: Preliminary BOM

- Nick calls this **"preliminary bill of material"** and explains that it is:
    - **Without PO numbers** – it's a full list of required materials, but **before** purchase orders are actually placed [Material Procurement Process Review].
- What he uses it for:
    1. **Coverage check** – to make sure "everything is covered" in terms of materials needed for the job [Material Procurement Process Review].
    2. **Stock check** – he takes this BOM out to the shop and:
        - Looks at what's already **in stock**.
        - Marks items that will be taken from stock instead of being purchased [Material Procurement Process Review].
        - He often already knows what's in stock (e.g., pipe sizes bought in bulk recently), so he marks those lines as stock [Material Procurement Process Review].
- The preliminary BOM can therefore contain:
    - Lines that will later receive PO numbers.
    - Lines that will be satisfied from **stock** (and later marked as such on the final BOM) [Material Procurement Process Review].

In short:
Preliminary BOM = full material list, before POs are created, used to (a) ensure completeness and (b) decide what's stock vs. to-be-purchased.

Stage 3: Final BOM

- After checking stock and creating POs, he **"converts this into the final BOM"** [Material Procurement Process Review].

- Final BOM characteristics:
  - **Has PO numbers** filled in for purchased items [Material Procurement Process Review].
  - **Marks stock lines** clearly as coming from stock instead of a vendor [Material Procurement Process Review].
  - Reflects:
    - Which vendor is supplying each purchased line.
    - Agreed **delivery dates** from vendor quotations/acknowledgements.
    - Which items are covered by long-lead orders vs. regular orders vs. stock [Material Procurement Process Review].
- Process Nick described:
  1. **Create preliminary BOM** from drawings.
  2. **Check stock** and mark items that will use existing stock.
  3. **Issue POs** (especially for long-lead and non-stock items).
  4. **Update the BOM** with:
     - Vendor PO number(s)
     - Estimated delivery dates
     - Stock indicators
       → This version is the **final BOM** [Material Procurement Process Review].

In short:
Final BOM = fully committed material plan, with POs and stock usage locked in.

---

3. Summary in Plain Terms

- **How he creates BOMs:**
  From drawings → into an Excel BOM → grouped by material/vendor → used to send RFQs and then to build POs in Job Boss [Material Procurement Process Review].

- **Long-lead BOM:**
  Early, partial BOM for big/slow/expensive items, ordered right away so price and schedule are protected [Material Procurement Process Review].
- **Preliminary BOM:**
  Complete material list with **no POs yet**, used to verify that nothing is missing and to identify what can come from stock vs. needs to be bought [Material Procurement Process Review].
- **Final BOM:**
  The cleaned-up, committed version with **PO numbers, delivery dates, and stock flags** filled in—this is the version that truly represents "what we're buying and from where" [Material Procurement Process Review].

If you'd like, I can turn this into a **one-page SOP** (with sections for "Inputs," "Outputs," and "Decisions per stage") that you can share with others or plug into a process doc.

Yes, do that please

Show thinking

Here's a one-page style SOP you can share or drop into a process doc.

SOP: Nick's BOM (Bill of Materials) Creation & Management Process

Source: "Material Procurement Process Review" [Material Procurement Process Review]

---

1. Purpose

Define how Nick creates, reviews, and finalizes Bills of Materials (BOMs) to support accurate material planning, RFQs, purchasing, and stock usage for fabrication jobs. Primary goals:

- Ensure **all required materials are identified**
- Separate **long-lead / critical items** from standard items
- Clearly distinguish **preliminary** vs **final** material commitments

---

2. Inputs

- **Approved / certified drawings** for the job (dimensions, tables, material callouts) [Material Procurement Process Review]
- Knowledge of **standard stock items** currently available (e.g., pipe sizes previously bought in bulk) [Material Procurement Process Review]
- Vendor contact list for RFQs [Material Procurement Process Review]

---

3. Outputs

- **Long-Lead BOM**: Partial BOM of high-value / long-lead materials ordered early [Material Procurement Process Review]
- **Preliminary BOM**: Full material list (no PO numbers yet) with initial stock vs purchase intent [Material Procurement Process Review]
- **Final BOM**: Fully committed BOM, with PO numbers, vendors, delivery dates, and stock flags [Material Procurement Process Review]

---

4. Roles & Responsibilities

- **Nick (Material Planner/Buyer)**
    - Creates long-lead, preliminary, and final BOMs
    - Performs stock checks against BOM
    - Sends RFQs and compares vendor quotes
    - Creates and updates POs in Job Boss [Material Procurement Process Review]
- **Vendors**
    - Provide pricing and lead times based on RFQs
    - Confirm final delivery dates and terms [Material Procurement Process Review]

---

5. Process Overview

Step 1 – Create the Initial BOM from Drawings

1. Review the **certified/final drawings** for the job [Material Procurement Process Review].
2. Extract all material requirements using drawing tables and dimensions:
    - Pipe sizes/lengths (calculate, e.g., diameter × π where needed)
    - Flanges, gaskets, nozzles, plate, etc. [Material Procurement Process Review]
3. Enter the data into an **Excel BOM** sheet (Nick's working BOM file) [Material Procurement Process Review].
4. **Group items by material type / vendor family** to simplify RFQs:
    - All pipe together
    - All flanges together
    - All gaskets together, etc. [Material Procurement Process Review]

Output: A working Excel BOM covering all materials for the job.

Step 2 – Generate the Long-Lead BOM

1. From the working BOM, identify **long-lead / high-value items**, typically [Material Procurement Process Review]:
    - Heads
    - Exotic materials
    - Plate
    - Large flanges or other major cost items
2. Copy these lines into a **Long-Lead BOM** subset.
3. Immediately send RFQs for these items and place POs as soon as pricing/lead times are confirmed [Material Procurement Process Review].

Output:

- Long-Lead BOM
- POs issued promptly for major/long-lead items to secure price and delivery.

Step 3 – Build the Preliminary BOM

1. Use the full working Excel BOM as the **Preliminary BOM** (no PO numbers yet) [Material Procurement Process Review].
2. **Coverage Check**: Confirm every material from the drawings is represented on the BOM [Material Procurement Process Review].
3. **Stock Check**:
    - Compare BOM against known **stock on hand** (Nick often knows recent bulk pipe purchases, etc.) [Material Procurement Process Review].
    - Identify lines that will be fulfilled from **stock instead of new purchase**.
    - Mark those lines (e.g., "From stock") on the Preliminary BOM [Material Procurement Process Review].

Output:

- Preliminary BOM = full list of required materials, with an initial notion of stock vs to-be-purchased, but **no PO numbers yet**.

Step 4 – RFQs & Vendor Selection

1. For **non-stock items**, send RFQs to **2–3 vendors per line** on average [Material Procurement Process Review].
    - Copy BOM lines (already grouped by vendor type) and paste into RFQ emails.
    - Nick does this **outside Job Boss** because he finds the built-in RFQ module too cumbersome [Material Procurement Process Review].
2. Collect quotes and compare:
    - Unit price
    - Total price
    - Lead time / delivery promises [Material Procurement Process Review].
3. Select vendors and decide which vendor gets each line.

Output:

- Vendor decisions for each purchased BOM line.

Step 5 – Create POs in Job Boss

1. In **Job Boss**, create POs using the chosen vendor quotations [Material Procurement Process Review]:
    - Vendor name
    - Item description & quantity
    - Unit cost & total cost
    - Ship method and ship-to location
    - Expected delivery date per vendor [Material Procurement Process Review].
2. Record PO numbers and confirm acknowledgement from vendors as needed.

Output:

- POs created in Job Boss for all purchased BOM items.

Step 6 – Convert Preliminary BOM to Final BOM

1. Take the **Preliminary BOM** and update it with final data:
    - Fill in **PO numbers** for each purchased line [Material Procurement Process Review].
    - Confirm and record **vendor name** per line.
    - Add **expected delivery dates** based on vendor confirmations [Material Procurement Process Review].
    - Clearly mark **stock lines** as supplied from inventory (no PO) [Material Procurement Process Review].
2. Check that:
    - Every required material is either:
        - Assigned to a PO, **or**
        - Clearly marked as stock.

    - There are no “orphan” lines with neither PO nor stock designation [Material Procurement Process Review].

Output:

- **Final BOM = authoritative material plan** for the job, with POs, vendors, dates, and stock usage all defined.

---

6. Controls & Review Points

- **Before issuing Long-Lead POs:**
  Confirm that identified long-lead items truly drive the schedule and represent major cost [Material Procurement Process Review].
- **Before converting Preliminary → Final BOM:**
    - Confirm all vendor quotes received and selected.
    - Double-check stock lines vs known inventory.
    - Confirm all POs are created and correctly linked to BOM lines [Material Procurement Process Review].

If you’d like, I can next:

- Turn this into a **flowchart description** (ready for drawing in Lucidchart/Miro/Visio), or
- Create a **checklist version** (tick boxes for each step) that supervisors or backup staff can follow.

No thank you. Can you give me a summary of my interview with Dustin - Operations Manager?

Show thinking

Here’s a summary of your interview-style conversation with Dustin (Operations Manager) from **“Manufacturing Process Automation Meeting”** on 2026-03-18 [Manufacturing Process Automation Meeting].

High-Level Summary

You and Dustin walked through how operations currently run on the shop floor and what's broken or inefficient. Dustin described the **job entry process, scheduling, time tracking, and reporting**, and you both explored how to **automate** these workflows (e.g., with Job Boss / Job Boss Square) to reduce manual effort and improve accuracy [Manufacturing Process Automation Meeting].

What Dustin Explained About Operations

1. Job Entry & Headcount Context

- A **receiving person for consumables** is being hired; your involvement there is temporary [Manufacturing Process Automation Meeting].
- **Job entry is manual**:
  - Chris starts a **job folder**.
  - Fills out a **job entry form** to get the job into the system.
- Dustin noted they are **tracking 24 personnel but planning for 22**, which affects how they model capacity [Manufacturing Process Automation Meeting].

---

2. Quoted Hours & Scheduling Approach

- For planning, Dustin uses about **85% of the quoted hours** to load the schedule.
  - The reason: avoid **over-inflating the schedule** and creating an unrealistic timeline [Manufacturing Process Automation Meeting].
- The **production schedule**:
  - Is updated **weekly (every Monday)**.
  - Distinguishes between:
    - Work already in the shop.
    - Jobs sold but **not yet released** (no certified drawings yet) [Manufacturing Process Automation Meeting].
- He walks you through how they **map out hours and deeper-dive schedules** for active projects [Manufacturing Process Automation Meeting].

---

3. Pain Points & Bottlenecks

a. Manual Time Entry & Timesheets

- Timesheets and time entry for jobs are highly **manual**.
- Example: for the **Vertiv project**, it took **around three hours** to input time that should have taken about **one hour**, due to:
    - Paper-based time sheets.
    - Manual re-entry into the system [Manufacturing Process Automation Meeting].
- This pulls key people (like Scott) away from focusing on actual operations, because they're "stuck entering time" [Manufacturing Process Automation Meeting].

b. Schedule & Project Chaos

- Dustin describes the environment as **reactionary** due to:
    - Delays, e.g., **Kimberly Clark** project pushing timelines.
    - Many overlapping projects in different stages.
- Tracking everything with current tools (spreadsheets, manual reports) produces **chaos and extra admin work** [Manufacturing Process Automation Meeting].

---

4. Efficiency Reporting

- Dustin has an **efficiency report** that compares:
    - **Actual operation times** vs.
    - **Planned/build times** from the routing [Manufacturing Process Automation Meeting].
- Challenges:
    - He has to **manually calculate** or compile a lot of this.
    - Reports and audits (employee time audits, operation reports) are pulled every **Monday**, adding to the reporting load [Manufacturing Process Automation Meeting].

- You discussed that this reporting work is **important but not efficient**, and ripe for automation [Manufacturing Process Automation Meeting].

---

5. Discussion About Automation & Tools (Job Boss / ERP)

- You and Dustin explored **using ERP capabilities** (Job Boss or Job Boss Square) to automate:
    - Time capture (digital timesheets / terminals instead of paper).
    - Efficiency reports.
    - Production planning and schedule updates.
    - Consolidation of data into **one source of truth** [Manufacturing Process Automation Meeting].
- Dustin agreed that:
    - They need **better data integration** and automation.
    - An ERP that pulls in job data, time, and performance automatically would dramatically reduce manual work and errors [Manufacturing Process Automation Meeting].
- You discussed:
    - Evaluating **Job Boss legacy vs Job Boss Square**.
    - Possibly starting with a **pilot** to test new workflows and then scaling up [Manufacturing Process Automation Meeting].

---

6. Project Management & Future State

- You suggested bringing **April** into project management to help reduce cross-lane work and clarify ownership across projects [Manufacturing Process Automation Meeting].
- Dustin emphasized:
    - The need for clearer **project management structure**.
    - Better **communication** and **visibility** across all active jobs [Manufacturing Process Automation Meeting].

- You both agreed on:
    - A **phased implementation** of automation/ERP.
    - Importance of **training** and change management so people can use the system effectively [Manufacturing Process Automation Meeting].

Short Version You Can Reuse

In this interview-style meeting, Dustin walked you through how operations currently run: **manual job entry, weekly scheduling based on 85% of quoted hours, and heavy reliance on manual timesheets and reports**. He highlighted specific pain points—like multi-hour time entry for projects and chaotic scheduling under delays—and you both agreed that **automation via Job Boss/ERP** is needed to streamline time capture, efficiency reporting, and production planning. You also discussed strengthening **project management and data integration** so operations can move from reactionary to more proactive and predictable [Manufacturing Process Automation Meeting].

If you'd like, I can next pull out **explicit action items** you and Dustin agreed on from this meeting.

Yes please

Show thinking

Here are the explicit action items from your interview/meeting with Dustin (Operations Manager) in **"Manufacturing Process Automation Meeting"** [Manufacturing Process Automation Meeting]:

Action Items Assigned to You (Speaker 0)

1. **Hire receiving person for consumables**
    - Bring on a **receiving person** dedicated to handling **consumables** for the shop.
    - Goal: take that load off existing staff and tighten control over incoming consumable materials.
    - **Status:** Open [Manufacturing Process Automation Meeting]
2. **Share JobBOSS rep contact**

- Provide the team with the **JobBOSS representative's email/contact information** so they can follow up on capabilities, modules, and pricing.
- **Status:** Open [Manufacturing Process Automation Meeting]

3. **Walk the tool room with Sammy**
    - Do a **tool-room walk-through with Sammy**.
    - Create a **consumables/materials needs list** based on what you see (missing items, low stock, standardization opportunities).
    - **Status:** Open [Manufacturing Process Automation Meeting]
4. **Host consumable-vendor automation meeting in April**
    - Schedule and run a meeting in **April** with:
        - The **consumables vendor**
        - **Lindy**
    - Purpose: discuss **automating tool/consumable replenishment** (e.g., vendor-managed inventory, scanning, or other automation).
    - **Status:** Open [Manufacturing Process Automation Meeting]
5. **Investigate JobBOSS / JobBOSS Square automation options**
    - Research how **JobBOSS / JobBOSS Square** can support:
        - **Travelers** and tablet use on the floor
        - **Scanner-based workflows** for time & job tracking
    - Evaluate which modules and integrations would work best for your shop.
    - **Status:** Open [Manufacturing Process Automation Meeting]

Action Item Assigned to Dustin (Speaker 1)

6. **Join Monday production/project meeting for observation**
    - Dustin to **attend and sit in on the Monday production/project meeting**.
    - Purpose: observe how people prepare, what reports they need, and where automation could help.

- **Status:** Open [Manufacturing Process Automation Meeting]

If you'd like, I can turn these into:

- A **checklist** you can track progress against, or
- A **draft email** assigning/confirming these action items with Dustin and the rest of the team.

Now can you summarize the meeting with me Aalhad and Rutang?

Show thinking

Here's a summary of your meeting with **Aalhad and Rutang** titled **"XML to Excel Integration Meeting"** [XML to Excel Integration Meeting].

High-Level Summary

You, Aalhad, and Rutang discussed how to **pull XML data into Excel** and then use that Excel data inside **Autodesk Inventor via iLogic**. The focus was on:

- Extracting **tank-related specifications** (like elevation from datum) from XML,
- Structuring that data in Excel, and
- Writing/using **iLogic code** to read from Excel, drive Inventor parameters, and apply proper **constraints** so models are accurate and reusable [XML to Excel Integration Meeting].

You also talked about using **templates for tank components** and possibly leveraging **Autodesk developer resources or code repositories** to speed things up [XML to Excel Integration Meeting].

Key Topics You Covered

1. XML → Excel Data Flow

- Aalhad walked through extracting values from **XML files**, such as **"elevation from datum"** and its sub-components [XML to Excel Integration Meeting].
- The **column headings in Excel** are generated from the XML structure; the idea is that each XML tag becomes a column so Inventor can later read those fields [XML to Excel Integration Meeting].

- You discussed the need to **code a parser** that:
    - Reads all required specifications from XML,
    - Writes them into a consistent Excel format [XML to Excel Integration Meeting].

2. iLogic + Excel Integration

- Aalhad showed you some **iLogic code** examples that read Excel files, including functions like **"find row"** and "title draw" [XML to Excel Integration Meeting].
- You noted the **difference in syntax** between XML handling and iLogic and that the current code (some originally from Gemini) needs fixes [XML to Excel Integration Meeting].
- The core idea: iLogic should **open Excel, find the correct row**, and then **map columns to Inventor parameters** (e.g., diameters, lengths, elevations) [XML to Excel Integration Meeting].

3. Forms, Parameters, and Tank Templates

- Aalhad explained how **forms in iLogic** are built from **parameters**:
    - Parameters (e.g., for dish heads, tank dimensions) are defined and then exposed in a form [XML to Excel Integration Meeting].
    - Currently, much of that data is **manually inputted** rather than automatically pulled from XML/Excel [XML to Excel Integration Meeting].
- You discussed using **templates for different tank components** (e.g., dish heads, shells) so that:
    - Once parameters are linked to Excel, a single form/template can handle multiple tank sizes and configurations [XML to Excel Integration Meeting].

4. Constraints & Model Accuracy

- A major pain point you raised: **lack of constraints** in the current setup [XML to Excel Integration Meeting].
    - Without robust constraints, changing dimensions from Excel/iLogic can produce **unstable or incorrect models**.
- You emphasized that for this to work in production:
    - The Inventor models must be **properly constrained**,

    - iLogic must **drive those constrained parameters**, not just dump numbers into geometry [XML to Excel Integration Meeting].

5. Tools, Resources, and Next Steps

- You suggested checking whether Autodesk provides:
    - A **developer kit**,
    - A **bank of iLogic snippets**,
    - Or example projects that show **Excel + iLogic** best practices [XML to Excel Integration Meeting].
- Aalhad agreed to look for:
    - **Existing repositories or code samples** that could be adapted instead of writing everything from scratch [XML to Excel Integration Meeting].
- As next steps, you aligned on:
    - Building/choosing an **XML parser** to produce a clean Excel spec sheet.
    - Getting a **working iLogic script** that reliably reads that Excel and drives a constrained Inventor model.
    - Continuing research and coordination between you, Aalhad, and Rutang on how to split the work and sequence it [XML to Excel Integration Meeting].

If you'd like, I can now:

- Extract **concrete action items** from this meeting, or
- Turn this into a **technical spec** (requirements doc) for the XML→Excel→iLogic pipeline.

Summarize the Project meeting from Thurs.

Show thinking

Here's a summary of the **Project Schedule Coordination Meeting** from Thursday (2026-03-26) [Project Schedule Coordination Meeting].

High-Level Summary

The meeting was a **job-by-job schedule and status review** across the shop. Chris, Dustin, John_QC, April, Nick and others walked through current and upcoming jobs, confirming **ship dates, inspection status, required repairs, material needs, and customer requirements**. The goal was to ensure each job's sequence (fabrication, inspections, paint, photos, water fill, shipping) stayed aligned with promised dates and to surface any risks early [Project Schedule Coordination Meeting].

Key Job & Schedule Highlights

- **Job 4624**
  - Due **April 13**; plan includes:
    - Dimensional checks
    - **Water fill** on the 16th
    - **Ship by the 24th** [Project Schedule Coordination Meeting]
  - Coordination around **crane usage**, water fill timing, and BTS presence during critical stages [Project Schedule Coordination Meeting].
- **Kimberly Clark Jobs 12, 13, 14**
  - All **scheduled to ship Monday**.
  - No major open issues flagged at the time [Project Schedule Coordination Meeting].
- **UT Inspections & Repairs**
  - UT checks revealed some **discrepancies/issues** that would require repair work.
  - Team discussed ensuring **Jeff is informed** so he doesn't make a wasted trip and that repairs are baked into the schedule [Project Schedule Coordination Meeting].
- **Job 53 (Andridge)**
  - **Scheduled for Monday**, with coordination around when it hits which bay and any dependency on other jobs [Project Schedule Coordination Meeting].
- **Jobs 6667 & 68**

    - In **paint**, with a plan to **ship Monday**.
    - Dustin mentioned earlier **blasting/painting delays** and how they impact final ship timing [Project Schedule Coordination Meeting].
- **Job 70**
    - Planned for **closure head shooting** on the **31st**.
    - Some repairs and UT challenges might affect that timeline, so it was being monitored [Project Schedule Coordination Meeting].
- **Jobs 83 & 92**
    - Both running **behind**, now targeting **shipping on the 13th**.
    - Team acknowledged the slip and adjusted expectations [Project Schedule Coordination Meeting].

Change Orders, Materials & Certification

- Discussed **change orders** and the need for **additional materials** like loose collars and blinds (e.g., Job 101 blinds and how to balance that work in the schedule) [Project Schedule Coordination Meeting].
- For **epic jobs 108, 109, 110**, as well as **Sylvamo** jobs:
    - Focus on whether **certified materials** were in hand or still needed [Project Schedule Coordination Meeting].
- Nick highlighted **material purchasing** needs for several jobs (e.g., 356, 516) to prevent material shortages from becoming a schedule problem [Project Schedule Coordination Meeting].
- Decision to **move jobs 102–106 out** in the schedule to better match customer timelines and internal capacity [Project Schedule Coordination Meeting].

New Jobs & Special Requirements

- New work coming in:

    - **Polyance** and **Blake & Pendleton** jobs introduced, both needing **drawings** and early planning [Project Schedule Coordination Meeting].

- **Job 116**:
    - Has **special requirements** (e.g., concrete saddles).
    - Group discussed starting to think about **installation and potential solutions**, including how that affects yard and shop sequencing [Project Schedule Coordination Meeting].

People & Next Steps

- **Staffing update**:
    - John_QC announced a **candidate accepted a job offer** and will **start Monday**—helpful for QC/inspection capacity [Project Schedule Coordination Meeting].
- Agreement to:
    - **Send a formal recap email** documenting job updates, ship dates, and key decisions.
    - **Schedule a dedicated meeting** to plan installation for specific jobs (e.g., 117 & 118, Coast a tech) [Project Schedule Coordination Meeting].
- Reminder to **check material status for Job 9293** and ensure everything is set for the upcoming week [Project Schedule Coordination Meeting].

If you'd like, I can next:

- Turn this into a **job-by-job dashboard style list** (Job # / current status / next step), or
- Extract **action items by person** from this project meeting.

Summarize my interviewS with Sherri

Show thinking

Here's a consolidated summary of your interviews/working sessions with **Sherri** across the six recordings [Time Management Process Review, Financial Management Overview, Payroll Processing, Invoice Processing Overview, HR Process Optimization Meeting, Accounts Payable Process Improvement].

---

1. Overall Focus of Your Interviews with Sherri

Across your conversations, you and Sherri are essentially mapping **how the back office runs today**—timekeeping, payroll, HR, AP/AR, and financial basics—so you can identify **where to automate, integrate systems, and reduce her manual workload** [Time Management Process Review, Payroll Processing, Invoice Processing Overview, HR Process Optimization Meeting, Accounts Payable Process Improvement].

Core themes:

- **Time & payroll processes**
- **HR & recruiting workload**
- **Invoice and AP handling**
- **Financial concepts & constraints**
- **Opportunities for automation and system integration**

---

2. Timekeeping & Payroll

From the **Time Management Process Review**, you dug into how time and payroll are actually handled day to day [Time Management Process Review]:

- **Punitive time clock rules**
    - Late after **6:01** = docked 15 minutes.
    - Early clock-ins before **5:46** get penalized/adjusted.
    - This creates confusion and frequent manual corrections.
- **Manual checking & spreadsheets**
    - Sherri uses a **time audit report** to verify that keyed timesheets match clock punches.

    - She built and maintains a **manual spreadsheet** to reconcile daily hours before payroll runs.
    - Once data is correct, systems like **Paychex/Paycheck and JobBoss** handle the calculations, but getting data *into* them is labor-intensive.
- **Triple data entry**
    - Employee information is entered into **Paycheck, JobBoss, and a Microsoft Access database**, causing redundancy and risk of inconsistency [Time Management Process Review].
- **ACA & reporting**
    - In your HR-focused interview, you discussed **ACA reporting**, pulling the right year-to-date and coverage data for a third-party filer, and distinguishing old vs. new health plans [Payroll Processing].

---

3. HR, Recruiting & Job Postings

In the **HR Process Optimization Meeting**, you focused on Sherri's HR workload and where automation could help [HR Process Optimization Meeting, Payroll Processing]:

- **Job postings & Indeed**
    - She has handled **multiple open roles at once** (e.g., five jobs running).
    - Uses **Indeed premium**, costing **$70–$100/day per job** to keep listings at the top [HR Process Optimization Meeting].
    - Receives a **huge volume of emails and applicants**, many unqualified due to weak screening.
- **Manual candidate handling**
    - Reviews each resume, marks **yes/no**, prints or saves to PDF, and logs in **spreadsheets** [HR Process Optimization Meeting].
    - HR in Savannah also gets copies; she and David share review responsibilities.
- **Growth pressure**

    - Workload has surged as the tank business scaled up (many more tanks, higher billings), increasing HR, payroll, and recruiting strain [HR Process Optimization Meeting].

- **Job post quality & AI screening**
    - Together you edited an **engineering manager** posting to:
        - Add **years-of-experience ranges** (e.g., 3–5 years).
        - Require a **bachelor's degree**.
        - Clarify the title so AI screeners and candidates are better aligned [Payroll Processing].

---

4. New Hires & Onboarding

You also walked through **onboarding operations** [Payroll Processing, Accounts Payable Process Improvement]:

- **New hire setup**
    - For each new employee, Sherri:
        - Sets them up in **JobBoss**, **Paychecks**, and time/attendance systems.
        - Handles **E-Verify** and **Georgia new-hire reporting within three days**.
        - Assigns **badges** and ensures orientation paperwork is done [Payroll Processing, Accounts Payable Process Improvement].
- **New hire packets**
    - Includes handbook, tax forms, enrollment forms, etc.
    - Today, much of this is still **printed and assembled manually**, though she has scanned copies to print from [Accounts Payable Process Improvement].

---

5. Invoices, AP, and Payments

Multiple sessions covered how Sherri handles **accounts payable** and invoice flow [Invoice Processing Overview, Payroll Processing, Accounts Payable Process Improvement]:

- **Invoice matching process**

    - Invoices (often emailed to **AP invoice@...**) are printed and filed into **vendor folders** [Accounts Payable Process Improvement].
    - Each invoice is matched to:
        - The **PO** (set up by Raton or Nick),
        - The **receiving paperwork** from the floor, and
        - The correct **GL code** [Invoice Processing Overview].
    - Problems arise when POs/GLs are wrong or receiving paperwork is missing.
- **Payment methods & upcoming ACH project**
    - Currently heavily **check-based**:
        - Print checks, sign, stamp envelopes, mail out.
        - Some **wires** (e.g., to India) require extra manual steps [Invoice Processing Overview].
    - A major upcoming project is implementing **ACH payments** to:
        - Cut down on paper checks and postage,
        - Take better advantage of **vendor terms and discounts** [Invoice Processing Overview, Payroll Processing].
- **Invoice/inbox overload**
    - Sherri receives and manages a **huge volume of email invoices** and attachments.
    - You discussed automating:
        - Collecting attachments into a single place,
        - Printing or archiving them in a more systematic way [Accounts Payable Process Improvement, HR Process Optimization Meeting].

---

6. Financial Concepts & Division of Roles

In the **Financial Management Overview**, Sherri also gave you some basic context on **depreciation** and how big equipment purchases are treated [Financial Management Overview]:

- **Depreciation basics**
  - Heavy equipment is **expensed over 10–30 years**, not all at once.
  - There's a difference between having cash to buy it and when/how it hits the books [Financial Management Overview].
- **Mutual role clarity**
  - You were clear that **finance isn't your area**, and Sherri admitted similar feelings about some of *your* work.
  - There's a tone of **mutual respect** and a plan for you to **observe her Monday workflow** without getting in her way [Financial Management Overview].

---

7. Big Picture: What You Learned About Sherri's World

Putting it all together, your interviews show that Sherri is:

- A central **hub for HR, payroll, AP, and basic finance/admin**,
- **Overloaded** with manual, paper-heavy and email-heavy processes,
- Forced to **duplicate data entry** across multiple systems, and
- Very aware of the **risks of errors** and the need for **accurate, compliant reporting** (payroll, ACA, new hires, vendor terms) [Time Management Process Review, Payroll Processing, HR Process Optimization Meeting, Invoice Processing Overview, Accounts Payable Process Improvement].

Your side of the discussion is largely about:

- **Documenting her processes clearly,**
- Identifying where **automation and integration** could reduce manual work (timekeeping, recruiting, invoicing, ACH, onboarding), and
- Making a plan to **prototype improvements** without disrupting her critical weekly cycles.

If you want next, I can:

- Turn this into a **role profile + pain-points + opportunities document** for Sherri, or
- Extract a **clean list of automation / improvement projects** that came out of these interviews.

I'll have you do: clean list of automation / improvement projects that came out of these interviews, after we get the rest of the info summarized -- Summarize the JazzHR Demo meeting

Show thinking

Here's a summary of your **JazzHR demo meeting** with Mark McKenzie [Kelly Fletcher and Mark McKenzie].

Purpose of the Meeting

You met with Mark to see how **JazzHR** could replace your current **manual, spreadsheet-heavy hiring process** and to evaluate which plan (Hero vs Plus) fits best. Your goal is for **hiring managers to own their own postings and candidate review**, with less administrative work for Sherri and you [Kelly Fletcher and Mark McKenzie].

Current Pain Points You Described

- Multiple open roles (e.g., welders, engineering manager) with:
    - **Manual resume handling**: printing, saving as PDFs, logging in Excel [Kelly Fletcher and Mark McKenzie].
    - Large volume of **unqualified applicants**, especially via Indeed [Kelly Fletcher and Mark McKenzie].
- About **7–10 hours/week** spent on repetitive hiring tasks [Kelly Fletcher and Mark McKenzie].
- Need for hiring managers to **screen and own candidates** instead of everything flowing through Sherri.

Key JazzHR Capabilities Mark Demonstrated

1. Roles, Access, and Workflows

- Hiring managers log in and **see only their own roles** [Kelly Fletcher and Mark McKenzie].
- You can define **custom workflows** per job:
    - Stages like New → Phone Screen → On-site → Offer → Hired/Rejected.

    - Different workflows for different roles (e.g., welders vs engineering manager) [Kelly Fletcher and Mark McKenzie].
- Integrations discussed:
    - Background checks,
    - **Payroll providers** such as Paychex/Paychecks [Kelly Fletcher and Mark McKenzie].

2. Job Creation & Posting

- Job creation includes:
    - Title, employment type, location, and other basics [Kelly Fletcher and Mark McKenzie].
- **Exposure** feature to help jobs rank higher on Google job searches [Kelly Fletcher and Mark McKenzie].
- Syndication to **free job boards** (Indeed, etc.) plus optional **paid promotions**:
    - Note: Some boards are picky about **1099 roles** and may not post them for free [Kelly Fletcher and Mark McKenzie].

3. Candidate Intake, Knockout Questions & AI

- You can create **custom application questions** and flag them as **knockout questions** so clearly unqualified candidates are auto-filtered [Kelly Fletcher and Mark McKenzie].
- **AI matching** (Plus plan):
    - Compares resume content to job descriptions,
    - Surfaces candidates with highest predicted fit [Kelly Fletcher and Mark McKenzie].
- Powerful filters:
    - By keywords in resumes, job source, tags, etc. [Kelly Fletcher and Mark McKenzie].
- Candidate profile view:
    - Resume, answers, internal discussion notes, and even **texting candidates** from within JazzHR [Kelly Fletcher and Mark McKenzie].

4. Automation & Communication

- **Automated email sequences**:
  - Auto-rejection emails for knocked-out candidates.
  - Tasks/reminders for hiring managers as candidates move through stages [Kelly Fletcher and Mark McKenzie].
- **Template-able** custom questions and workflows to standardize hiring across multiple roles [Kelly Fletcher and Mark McKenzie].
- A discussion tab per candidate for collaboration and internal comments [Kelly Fletcher and Mark McKenzie].

Plans & Pricing Discussed

- **Hero Plan**:
  - Lower cost (about **$110/month month-to-month**) [Kelly Fletcher and Mark McKenzie].
  - More basic feature set (fewer automation and AI capabilities).
- **Plus Plan**:
  - About **$350/month month-to-month** [Kelly Fletcher and Mark McKenzie].
  - Includes **AI matching, knockout logic, more automation**, and richer workflow tools.
- Add-on roles: around **$9 per extra role/month**; annual pricing also available [Kelly Fletcher and Mark McKenzie].

Key considerations:

- You want enough automation to materially reduce Sherri's workload.
- You also want hiring managers to **self-serve** job postings and candidate review [Kelly Fletcher and Mark McKenzie].

Trial & Next Steps from the Call

- You requested a **free 14-day trial**:

    - To test **Plus vs Hero** features and see what you truly need [Kelly Fletcher and Mark McKenzie].
- Mark explained trial **limitations**:
    - Trial accounts **cannot post directly** to some of the big boards (Indeed/LinkedIn/Glassdoor/ZipRecruiter) in full production mode, so real-world volume won't be identical [Kelly Fletcher and Mark McKenzie].
    - Can't run two simultaneous independent trials (Hero and Plus) under separate accounts without QA flagging it [Kelly Fletcher and Mark McKenzie].
- Plan:
    - Mark will **set up a Plus trial** under a **company-domain email**, not Gmail, and send you onboarding instructions [Kelly Fletcher and Mark McKenzie].
    - You can **email him to switch** from Plus down to Hero during the trial if you want to compare behavior [Kelly Fletcher and Mark McKenzie].
    - He will also send you a **quote** and follow-up details that afternoon [Kelly Fletcher and Mark McKenzie].

Here's a consolidated summary of your three interviews/working sessions with **John_QC**: **QC Dept. Interview** [QC Dept. Interview], **Material Inspection Process Review** [Material Inspection Process Review], and **Quality Control Process Review** [Quality Control Process Review].

---

1. Big Picture: What You Were Doing with John

Across all three sessions, you and John were mapping how **Quality Control actually works today** at Savannah Tank:

- How welders and their certifications are tracked.
- How materials are inspected and quarantined.
- How welds, inspections, and test documents are recorded and stored.
- Where **manual paperwork, folders, and "tribal knowledge"** live.
- Where **automation (scanners, digital tracking, integration with JobBoss)** could realistically help [QC Dept. Interview, Material Inspection Process Review, Quality Control Process Review].

You were explicitly probing for **pain points** and **opportunities for a scanner / traveler system and digital QC**.

---

2. Welder Tracking & Job-Level QC (QC Dept. Interview)

Core system & responsibilities

- John runs a **Welder Tracking System** that:
  - Creates a **profile** for each welder.
  - Tracks **certifications** and welding processes they are qualified for.
  - Maintains a **continuity log** that must be updated at least every six months to keep each welder active [QC Dept. Interview].

Continuity & job tracking

- He runs **continuity logs** that tie welders, jobs, and procedures together, but:
  - Much of this is **manual entry** by job number and procedure.
  - When the shop is busy, continuity updates fall behind [QC Dept. Interview].

Folders, fit-up sheets & NDE

- For each job, John creates **physical folders** for:
  - Drawings and **fit-up sheets**.
  - QA/QC documents and hold-point records [QC Dept. Interview].
- He defines **hold points**—stages where work must stop until QC inspects and signs off [QC Dept. Interview].

Key pain points

- Work sometimes **advances without inspections being logged**, leading to rework and frustration.
- Everything is very **paper-heavy**: folders, printed fit-up sheets, manual signatures/initials.
- No tight integration with **JobBoss, drawings, or a scanner-based traveler** [QC Dept. Interview].

Automation ideas you explored

- A **scanner/traveler** system that:
    - Associates welders, jobs, and procedures with barcodes/QR codes.
    - Updates continuity logs automatically when work is scanned.
    - Triggers **hold-point notifications** so the shop can't skip inspections [QC Dept. Interview].

---

3. Material Inspection & Quarantine (Material Inspection Process Review)

Hold points and 100% weld tracking

- John wants to inspect **100% of welds**, not just samples.
- Uses **AA marks with dates** and documentation to show what's been checked and when [Material Inspection Process Review].

Documentation: MTRs & RIRs

- Uses **Material Test Reports (MTRs)** and **Receiving Inspection Reports (RIRs)**:
    - To tie heat numbers and material properties to incoming plate, pipe, flanges, etc.
    - Challenges include issues like **China melt** restrictions, ensuring material origin and certs are acceptable [Material Inspection Process Review].

Detailed inspection steps

- For flanges, plates, and other materials, John measures:
    - Dimensions, drilling patterns, and thickness.
    - Uses tools like a **Panametrics MG2 thickness meter**, but he's not thrilled with its accuracy compared to higher-end NDT gear [Material Inspection Process Review].

Quarantine process

- New materials go to a **quarantine area**:
    - Marked with **plastic chain** and job/heat info after acceptance.
    - Materials are **marked with job numbers and details** to avoid re-measuring and confusion later [Material Inspection Process Review].

Problems & improvement ideas

- A lot of **manual updating and scanning** of paper documents—slows him down and risks errors.
- You discussed having all inspection data **in one digital place**, possibly with:
    - Direct digital capture of thickness and inspection data.
    - Better links between material, job number, and inspection record [Material Inspection Process Review].

---

4. Welding Procedures, Equipment & Documentation (Quality Control Process Review)

Human verification is non-negotiable

- You and John agreed that even with automation:
    - QC still needs **human verification**, initials, and dates on key check sheets.
    - "Trust but verify" in line with **ASME requirements** [Quality Control Process Review].

RT film and non-digital artifacts

- **Radiographic (RT) film** can't be easily scanned into their systems:
    - A third party (ATS) does the X-ray and sends **PDF reports**, but the film itself stays analog.
    - You talked about potential **digital RT / computer radiography**, but it's expensive [Quality Control Process Review].

Sub-arc welding setups

- Current sub arc process:
    - Uses **sub arc tractors** (older Lincoln model) that lay wire and flux.
    - Hard to monitor precisely; they sometimes need **rails** or better guidance to keep welds straight [Quality Control Process Review].
- Newer setup:

    - A **column-and-boom** with a **remote-controlled tractor**, which opens possibilities for more consistent welds but requires new QC support [Quality Control Process Review].

PQRs, WPSs, and new materials

- For any new material or configuration (e.g., special alloys like 22 or 5), John must:
    - Create **Performance Qualification Reports (PQRs)**.
    - From those, derive **Welding Procedure Specifications (WPSs)**.
    - Use **ATS to test** (tensile, bend, etc.), then input results and produce test reports [Quality Control Process Review].
- These procedures and reports have to be:
    - **Created, filed, and maintained**, and updated when equipment or materials change [Quality Control Process Review].

---

5. Cross-Cutting Themes from All Three Interviews

Where John is strong

- Deep control over:
    - **Welder qualifications and continuity**.
    - **Material verification, quarantine and MTR/RIR tracking**.
    - **Welding procedures and code compliance** [QC Dept. Interview, Material Inspection Process Review, Quality Control Process Review].

Main pain points

- Heavy reliance on **paper folders, manual marking, and re-entry of data**.
- Limited integration with:
    - **JobBoss** (jobs, operations, times).
    - Drawings and digital traveler systems.
    - Digital NDE (RT, thickness data) [QC Dept. Interview, Material Inspection Process Review, Quality Control Process Review].

- Risk when the shop **moves faster than QC paperwork**—welds done before inspections are logged, continuity not updated in time, etc. [QC Dept. Interview].

Your shared vision for improvement

- Introduce a **scanner/traveler system** to:
    - Tie welders, jobs, operations, and inspections together in real time.
    - Enforce **hold points** digitally (no scanning, no go).
    - Auto-feed continuity logs, job status, and inspection records [QC Dept. Interview].
- Centralize **QC data** (welder logs, MTR/RIR, inspection marks, RT reports, PQR/WPS) into a **single digital repository** instead of scattered folders [Material Inspection Process Review, Quality Control Process Review].

Here's a consolidated, de-duplicated list of **automation and process-improvement projects** that emerged across your interviews and meetings (Sherri, John_QC, Dustin, Nick, Aalhad/Rutang, JazzHR demo, project meetings). I've grouped them by area so you can turn this into a roadmap.

---

1. Hiring & HR Automation

1.1 Implement JazzHR for Recruiting & Hiring

Source: JazzHR demo [Kelly Fletcher and Mark McKenzie], Sherri HR interview [HR Process Optimization Meeting, Payroll Processing]

- Replace manual Indeed posting, resume printing, and Excel tracking with **JazzHR**.
- Configure:
    - **Knockout questions** and AI matching to reduce unqualified applicants.
    - **Standard workflows** by role (welders, engineering manager, etc.).
    - **Hiring-manager–specific logins** so managers own their postings and candidate review.
- Integrate JazzHR (where possible) with **Paychex/Paychecks** and internal processes.

Project: Evaluate Hero vs Plus, run trial, then implement and train hiring managers.

1.2 Streamline New-Hire & Onboarding Workflow

Source: Sherri – HR & onboarding [Payroll Processing, Accounts Payable Process Improvement]

- Automate or semi-automate:
    - Generation of **new hire packets** (handbook, tax forms, benefits forms, etc.).
    - Data entry into **JobBoss, Paychecks, and time/attendance** from a single source.
    - **E-Verify** and **GA new-hire reporting** reminders/checklists.
- Goal: Turn multiple manual steps into a guided, trackable onboarding flow.

Project: Design an onboarding checklist + consider a form-driven or workflow tool that pushes data into each system.

---

2. Timekeeping & Payroll

2.1 Integrated Time & Attendance → Payroll Pipeline

Source: Sherri – time management & payroll [Time Management Process Review, Payroll Processing]

- Reduce reliance on:
    - Manual **time audit spreadsheets**,
    - Manual clock punch corrections,
    - Triple data entry (Paychecks, JobBoss, Access).
- Potential improvements:
    - Configure **time-clock rules** that are less punitive and require fewer edits, or add validation on import.
    - Build a **single "employee master"** feeding Paychecks, JobBoss, Access.
    - Automate daily reconciliation reports instead of manual spreadsheets.

Project: Define "ideal future" employee/time data flow and implement integration or ETL scripts between systems.

2.2 ACA & Payroll Reporting Automation

Source: Sherri – ACA & reporting [Payroll Processing, Time Management Process Review]

- Automate generation of:
    - **ACA data extracts** for the third-party filer.
    - YTD and coverage reports needed for compliance.
- Reduce manual report-building in Paychecks and Excel.

Project: Requirements doc for the exact fields/reports needed, then build saved reports or a recurring export process.

---

3. AP, Invoices & Payments

3.1 AP Invoice Capture & Matching Automation

Source: Sherri – AP & invoice handling [Invoice Processing Overview, Payroll Processing, Accounts Payable Process Improvement]

- Automate as much as possible of:
    - Collecting invoice **emails/attachments** into a structured queue.
    - Matching invoices to **POs, receiving paperwork, and GL codes**.
    - Reducing manual printing and vendor-folder filing.
- Long-term: push invoices + receiving + PO data into a **single view** for approval and posting.

Project: Evaluate simple AP automation/Inbox-to-AP tool or build a script/workflow that tags and routes AP emails with attachments plus links to PO/receiving data.

3.2 ACH Vendor Payments & Check Reduction

Source: Sherri – invoice & payment process [Invoice Processing Overview, Payroll Processing]

- Implement **ACH payments** to replace most manual checks:

    - Configure ACH utility with bank.
    - Map Vendors → ACH info and terms.
    - Update workflow from "print, sign, stuff envelopes" to "approve & transmit payment file."
- Continue to support wires and special cases, but minimize one-off check runs.

Project: ACH implementation (requirements, testing, rollout) plus new payment-approval workflow.

---

4. QC & Shop-Floor Tracking (John_QC + Dustin)

4.1 Scanner / Traveler System for QC & Production

Source: John_QC interviews [QC Dept. Interview, Material Inspection Process Review, Quality Control Process Review]; Dustin operations meeting [Manufacturing Process Automation Meeting]

- Design a **barcode/QR traveler system** to connect:
    - Job, operation, welder, inspector, and material.
    - **Hold points** (no scan, no proceed).
    - Automatic updates to **continuity logs** and inspection records.
- Integration points:
    - JobBoss (jobs/operations, hours).
    - Welder tracking DB.
    - QC documentation (fit-up sheets, inspections, NDE results).

Project: Start with a pilot traveler + scanner flow on a handful of jobs, then expand.

4.2 Digital QC Documentation Hub

Source: John_QC – QC, material inspection, PQR/WPS [QC Dept. Interview, Material Inspection Process Review, Quality Control Process Review]

- Consolidate:

    - **Welder profiles & continuity logs**.
    - **MTRs, RIRs, fit-up sheets, RT reports, PQRs, WPSs**.
- Goal: A **single digital repository** / index per job instead of scattered paper folders and shared drives.

Project: Choose structure (DMS/SharePoint/custom app) + define naming/metadata standards and migration approach.

4.3 Semi-Digital NDE & Material Data Capture

Source: Material inspection & RT discussions [Material Inspection Process Review, Quality Control Process Review]

- Improve how you handle:
    - Thickness readings (e.g., from Panametrics MG2).
    - RT film PDFs from ATS.
- Goals:
    - Ensure readings and acceptance decisions are **captured as data** (not just on paper).
    - Link them directly to **job/heat/weld locations**.

Project: Evaluate simple input forms or tablet-based checklists where John enters measurements once, linked to job & material.

---

5. Scheduling, Production & JobBoss Use (Dustin, Nick)

5.1 Automate/Improve Production Scheduling & Reporting

Source: Dustin – operations/automation meeting [Manufacturing Process Automation Meeting], project scheduling meeting [Project Schedule Coordination Meeting]

- Use JobBoss (or successor) to:
    - Replace spreadsheet-driven **Monday production schedules** and manual efficiency reports.

    - Automatically calculate **efficiency (actual vs planned hours)** and produce weekly dashboards.
- Reduce time Dustin and others spend creating:
    - Operation and employee time audits.
    - Manual "chaos management" across jobs.

Project: Define the schedule/report set you want each Monday, then configure JobBoss reports or a BI layer to generate them automatically.

5.2 Time Entry & Timesheet Automation on the Shop Floor

Source: Dustin operations meeting [Manufacturing Process Automation Meeting]

- Replace paper timesheets and multi-hour manual entry (e.g., Vertiv job data) with:
    - **Terminals/tablets + scanners** for operators to log time by job/operation.
    - Direct feed of those hours into JobBoss and payroll/time systems.

Project: Pilot tablet/scanner time entry on one or two lines/jobs, measure reduction in Scott's manual data entry time.

5.3 BOM & Procurement Workflow Optimization

Source: Nick – Material Procurement & PO Management [Material Procurement Process Review, PO Management Process Review]

- Digitize/standardize Nick's:
    - **Long-lead BOM** → early purchasing.
    - **Preliminary BOM** → stock check and coverage verification.
    - **Final BOM** → POs, delivery dates, stock flags.
- Potential improvements:
    - Structure BOMs in a system (or better Excel + macros) that:
        - Auto-groups by vendor.
        - Generates RFQ email content.

- Tracks status of lines (stock vs ordered vs pending quote).

Project: Document current BOM workflow, then design a structured template or light app that supports the three BOM stages end-to-end.

---

6. Engineering & CAD Automation (Aalhad & Rutang)

6.1 XML → Excel → Inventor iLogic Pipeline

Source: XML to Excel Integration Meeting [XML to Excel Integration Meeting]

- Build an automated pipeline where:
  - **XML files** (with tank spec data, elevations, etc.) are parsed into a consistent **Excel spec sheet**.
  - **iLogic** reads the Excel row for a job and drives Inventor models (parameters, dimensions) from it.
- Parallel work:
  - Define and harden **constraints** in Inventor models so parameter changes stay stable.
  - Create **reusable templates** for tank components (shells, heads, nozzles).

Project: Write/spec a parser + standard Excel layout, and refactor key Inventor models to be constraint- and iLogic-friendly.

---

7. Cross-Cutting "Foundation" Projects

7.1 Data & System Integration Map

Source: Sherri, Dustin, Nick, John_QC – all interviews

- Create a **system map** of:
  - JobBoss, Paychecks/Paychex, Access DB, JazzHR, QC systems, AP/ACH, Inventor/iLogic.
- Identify:
  - Where the **same data** (employee, job, PO, material, weld) is re-keyed.
  - Key integration points to reduce duplication and errors.

Project: One documentation + design effort that then informs which integrations/ETL jobs bring the biggest ROI.
